# Neural Networks Verification as Piecewise Linear Optimization

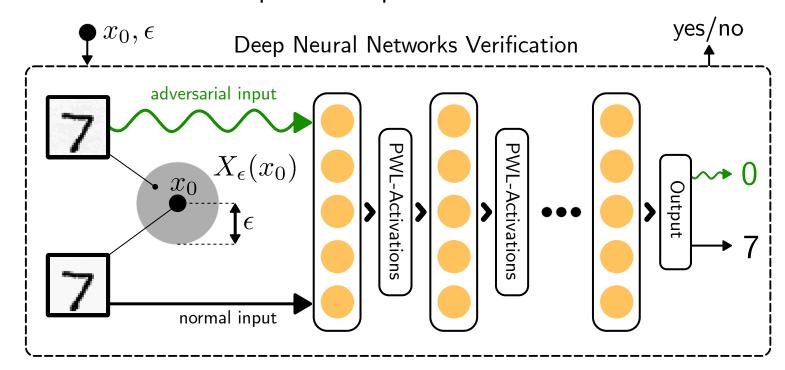

DIMACS Rutgers University May 23-26, 2022

Tu Anh-Nguyen Joey Huchette

#### **Abstract**

In this work, we provide a strong (ideal) MIP formulation for the neural network verification task, which extends the work of Anderson et al. [1] Our contributions are summarized as follows.

- > We derive a polynomial algorithm to obtain the facet-defining hyperplane for the Cayley embedding of the graph of activation functions.
- > Empirically, our formulation are shown to give tighter LP relaxations for relaxed verifiers and improves the performance of exact verifiers.

#### MIP Formulation of NN Verification using Cayley Embedding

output of a neural net  $\lim_{x \in X_{\epsilon}(x_0)} c \cdot \underline{M(x)} \leq \xi?$   $\lim_{x \in X_{\epsilon}(x_0)} c \cdot \underline{M(x)} \leq \xi?$  expanded form Cayley Embedding  $\max_{x \in X_{\epsilon}(x_0)} c_1 + \cdots + c_{n_2} y_{n_2}$   $\underline{(x_1, \dots, x_i) \in \operatorname{gr}(g_i(x_1, \dots, x_{i-1})) \quad \forall i \in \{n_1 + 1, \dots, N\}}$   $\underline{(x_1, \dots, x_{n_1}) \in X_{\epsilon}(x_0)}$   $y = (x_{N+1-n_2}, \dots, x_N),$  non-linear constraints

➤ The convex hull of the Cayley embedding is infact a polytope with an exponential number of faces. Hence, we need to derive an efficient separation procedure.

**Lemma 1.** Given  $(\hat{x}, \hat{y}, \hat{z})$ , if the optimal value of the following problem is greater than  $\hat{y}$  then  $(\hat{x}, \hat{y}, \hat{z})$  is feasible, otherwise, the optimal solution  $\alpha^*$  corresponds to a hyperplane that cut off  $(\hat{x}, \hat{y}, \hat{z})$ 

$$\text{\it subject to} \ \underbrace{\begin{bmatrix} A & 0 & \dots & 0 & I_n \\ 0 & A & \dots & 0 & I_n \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & \dots & A & I_n \end{bmatrix}}_{\hat{A}} \begin{bmatrix} \beta^1 \\ \bar{\gamma}^1 \\ \bar{\theta}^1 \\ \vdots \\ \bar{\beta}^k \\ \bar{\gamma}^k \\ \bar{\theta}^k \\ \bar{\alpha} \end{bmatrix} = \begin{bmatrix} \frac{a_1}{s} \bar{w} \\ \frac{a_2}{s} \bar{w} \\ \frac{a_3}{s} \bar{w} \\ \vdots \\ \frac{a_k}{s} \bar{w} \end{bmatrix}, \ \textit{and} \ \begin{bmatrix} \bar{\beta}^1 \\ \bar{\gamma}^1 \\ \bar{\theta}^1 \\ \vdots \\ \bar{\beta}^k \\ \bar{\gamma}^k \\ \bar{\theta}^k \end{bmatrix} \geq \mathbf{0}$$

**>>> Theorem 1.** The separation procedure can be done in  $O(n\log(n+\max(k,n)))$  time complexity

### Motivating Example: Staircase Function

A univariate piecewise linear function  $f: \mathbb{R} \to \mathbb{R}$  with k pieces is a staircase function if there exists  $s \in \mathbb{R}$  such that every pieces slope  $a_i \in \{0, s\}$ .

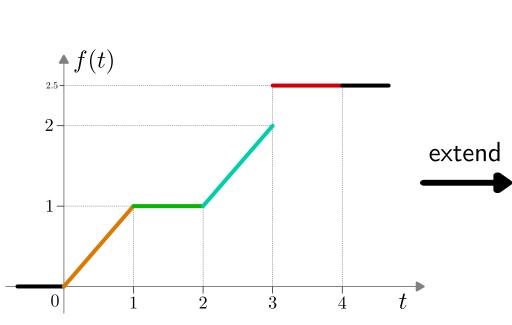

Fig. 1: 1D Staircase Function

A piecewise linear function  $f: \mathbb{R}^n \to \mathbb{R}$  is a k-piece staircase function if  $f=g(w\cdot x)$  where g is a univariate staircase function.

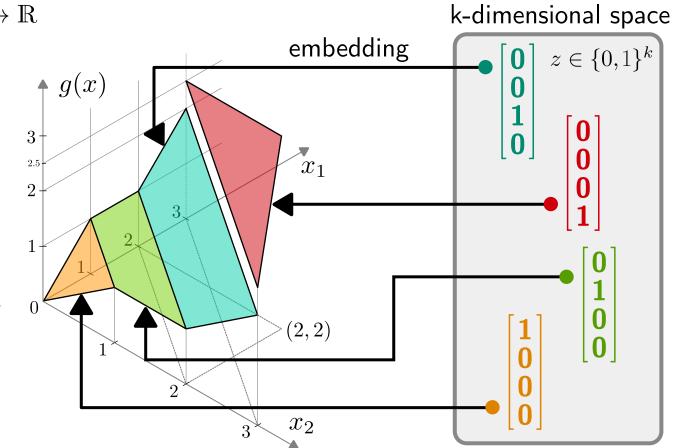

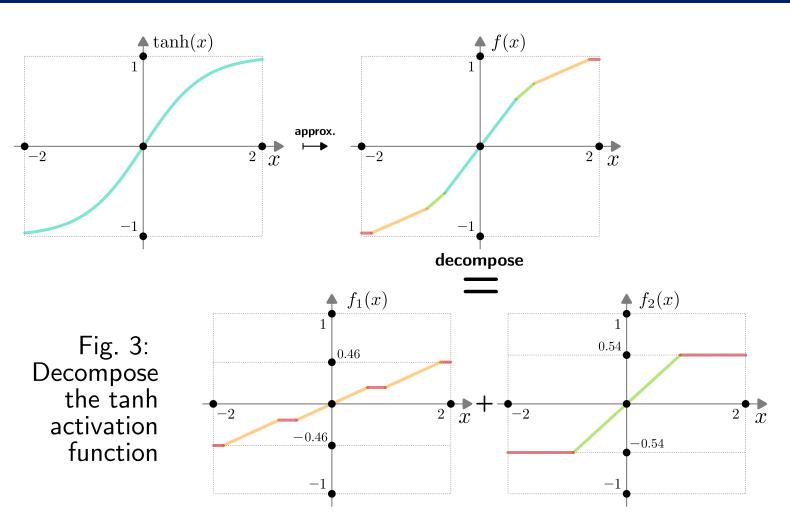

Fig. 2: 2D Staircase Function and Cayley Embeddings

Let  $D^i := \{x \in D | h_{i-1} \le w \cdot x + b \le h_i\}$ , the Cayley Embedding [2] for the closure of graph of f is:

$$S_{\text{Cayley}}(g) \coloneqq \bigcup_{i=1}^k \{(x, y, z) | x \in D^i, y = f(x), z = e^i \}$$

## **Composition of Staircase Functions**

# **Experimental Results**

Table 1: Relaxed Verifiers
